Fakturama Image-to-Cash Automation

Objective

Build a system that turns a single order image into a fully saved, verified Order and linked Invoice inside Fakturama — extracting the source data, resolving or creating the Debtor and Product master records, and applying the correct payment status, without relying on hardcoded coordinates or a fixed UI layout.

This task is intentionally larger than the timebox. We don't expect a fully complete flow — do as much as you can in the time and be ready to talk through what's left. That tradeoff is close to real work here: the scope is usually bigger than the clock.

Part 1: Design Doc

Timebox: Up to 90 minutes Deliverable: 1–4 pages, no code

Context

- Fakturama is a desktop invoicing/accounting application. You'll receive a single order image (for example, a scanned or photographed purchase order) as the only input.
- Download Fakturama at https://www.fakturama.info/download/.
- The system must extract structured data from that image, then use Fakturama's UI to resolve or create the Debtor, resolve or create each Product (and its VAT rate), build the Order, generate a linked Invoice, and apply the extracted payment status — verifying each step before moving to the next.
- This part is intentionally open in how you'd locate and interact with Fakturama's UI controls and how you'd extract and validate the source data. There's no single correct answer.

Your Task

Write a short design document describing how you would build this system. No code required for this step. You may structure the document however you like. Examples of topics include:

- Control-discovery / grounding strategy: how you'd reliably find and interact with Fakturama's UI elements
- Image-extraction strategy
- Tradeoffs of your approach

Part 2: Implementation

Timebox: Up to 5 hours — do as much as you can Deliverable: Git repo

Context

Based on the design document you just completed, you'll now implement the Fakturama Image-to-Cash automation: one continuous Order-first flow from a supplied order image through a saved, verified Invoice. Note anything you skipped in your README and the written questions below.

Required implementation approach

- Use Microsoft UI Automation (UIA), OCR, and/or LLMs

Core Task

Implement one continuous Order-first flow from a supplied order image. Extract the source data, open a New Order, and use the Order's Debtor and Product selectors as the existence checks. Create missing master data only when an exact selection is unavailable, then return to the same open Order. Complete the Order, create its linked Invoice, apply the extracted payment status, and verify the saved records. Screenshots below are UI references; the Product procedure is shown for one line and repeats for every additional item.

1. Extract the image and open a New Order

ITEMS

#	SKU	Description	Qty	Unit	Unit net (EUR)	Disc.	VAT	Line net (EUR)
1	**CHR-ERG-01**	Ergonomic Desk Chair	2	pcs	250.00	10%	19%	**450.00**
2	**MAT-DESK-02**	Anti-Fatigue Desk Mat	3	pcs	40.00	0%	19%	**120.00**

NET TOTAL	VAT TOTAL	GROSS TOTAL
EUR 570.00	**EUR 108.30**	**EUR 678.30**

All data is synthetic | Prices are net | Dates: YYYY-MM-DD | Currency: EUR

WEB-2026-0714-A17

1.1. Use **OCR** and/or an **LLM** as needed to extract and normalize the supplied order image.
1.2. Extract the **Order Date** and **External Reference**; Debtor company, contact, alias, addresses, and payment data; and every item **SKU**, description, quantity, unit net price, **VAT** percentage, discount, and source total.

Open the Order first

1.3. Click **Order** in the top toolbar and wait for the New **Order** editor.
1.4. Leave the automatically proposed **No.** unchanged.
1.5. Set **Date** to the extracted **Order Date**.
1.6. Enter the extracted **External Reference** in **Cust.Ref.**
1.7. Set the document price mode to **Net** and keep **VAT** as **With VAT**.
1.8. Keep this **New Order** tab open while resolving a missing **Debtor**, payment method, **VAT** rate, or **Product**.

2. Select or create the Debtor

Try to select the Debtor from the Order

2.1. Click the upper existing-contact icon beside **Addresses**. Do not click the lower green + icon, which starts a new **Debtor**.
2.2. In **Select the address**, search using the extracted **Company** or customer name and wait for the list to stabilize.
2.3. Treat a **Debtor** as an exact match only when the visible **Company**, **First Name**, **Name**, **ZIP**, and **City** match the extracted values. If one exact row appears, select it and click **OK**. If results are conflicting or ambiguous, stop for manual review. If no exact row appears, click **Cancel** and continue with the creation branch below. See Figure 1.

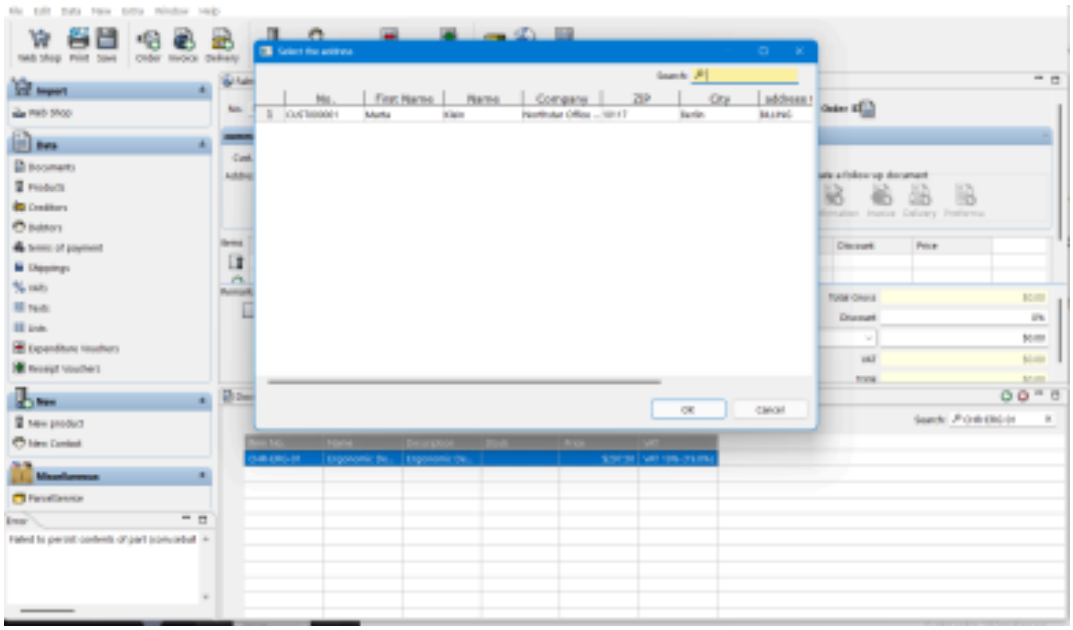

Figure 1. Address selector used to find and select an existing Debtor from the open Order.

2.4. When an existing Debtor is selected, confirm that the populated **Invoice address** and **Delivery address** match the source image, then continue to **Product** selection.

2.5. Keep the **Order** tab open, click **New Contact** in the left New panel, and wait for the **New Debtor** editor.
2.6. Leave Fakturama's proposed **Customer ID** unchanged. Enter the extracted **Company**, **First Name**, and **Last Name**; leave **Salutation** as --- when none is supplied.

2.7. On **Addresses** > **Main address**, enter the billing **Street**, **ZIP**, **City**, **Country**, **E-Mail**, and **Telephone**. Fill additional name, Address specification, or district only when the source supplies those values.
2.8. Assign the **Main address** the **Invoice address** role. If billing and delivery are identical, also assign the **Delivery address** role and do not create another address. See Figure 2.

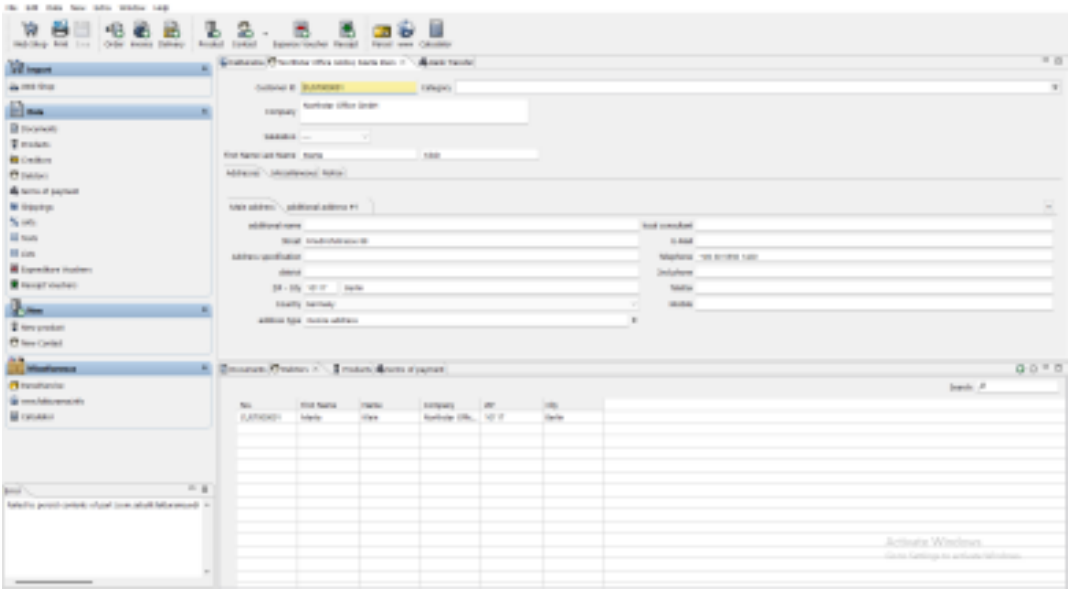

Figure 2. Main address completed and assigned the Invoice address role.

2.9. Open **Miscellaneous**. Enter **Alias name**, set **Discount** to 0%, and set **Net or Gross** to **Net**.
2.10. Open **Payment** and select the exact **Payment Method** extracted from the image. If it is unavailable, keep the **Debtor** editor open and create it with the following steps.
2.10.1. Open **Data > terms of payment** and search the exact **Payment Method**.
2.10.2. If one unambiguous exact **Payment Method** already exists, return to the **Debtor** editor, select it, and skip the remaining payment-creation substeps. If multiple exact rows or a conflicting definition appears, stop for manual review. If no exact row exists, click the green + control at the upper-right of the list.
2.10.3. Set **Name** and **Description** to the exact **Payment Method** and leave **Account** blank.
2.10.4. Set the payment-code dropdown using this mapping: **Bank Transfer** = **Credit transfer**; **Credit Card** = **Credit card**; **SEPA Direct Debit** = **SEPA direct debit**.
2.10.5. Set **Cash discount**, **Discount Days**, and **Net Days** to 0. Leave Text 'unpaid', Text 'deposit', and Text 'paid' blank, and do not click **Set as standard**.
2.10.6. Click the toolbar **Save** control once, return to the open **Debtor** editor, and select the new **Payment Method**. See Figure 4.

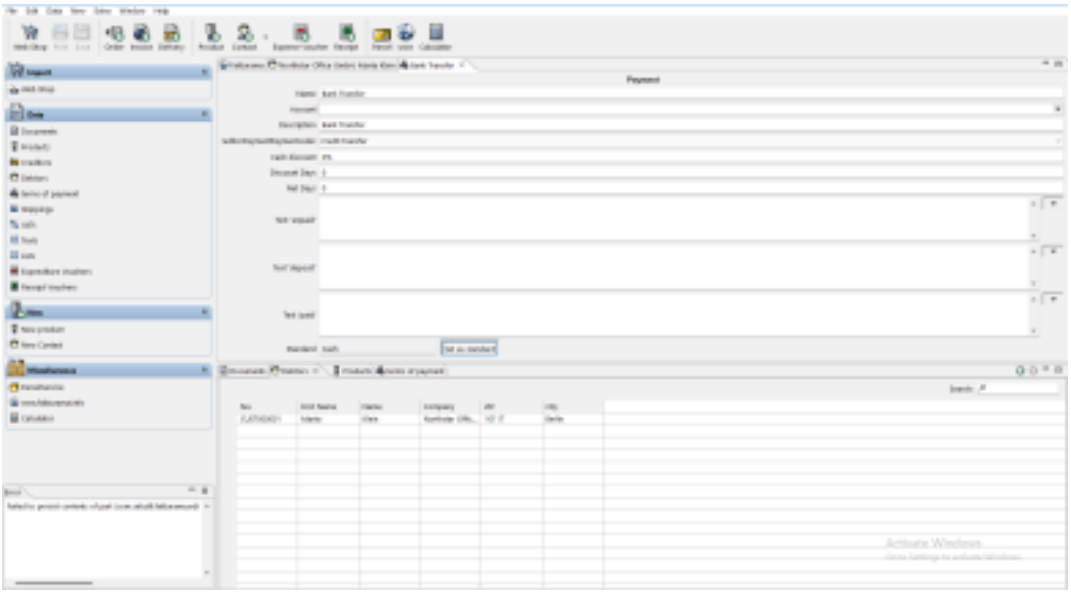

Figure 4. Conditional Bank Transfer setup using the Credit transfer payment code.

2.11. **Save** the **Debtor** once.
2.12. Return to the still-open **Order**, reopen **Select the address**, search again, select the newly saved **Debtor**, and click **OK**.
2.13. Confirm that the **Invoice address**/**Delivery address** now populate correctly. Successful selection from the **Order** confirms that the new **Debtor** was saved.

3. Select or create each Product

3.1. Run this complete selection branch for every extracted item row, in source order.

Try to select the Product from the Order

3.2. Click the upper **Product**-selection icon beside the **Items** table. Do not use the green + control.
3.3. In **Select a product**, search the exact extracted **SKU**. If one exact **Product** appears, select it and click **OK**. If results conflict, stop for manual review. If no exact **SKU** appears, click **Cancel** and use the creation branch below. See Figure 5.

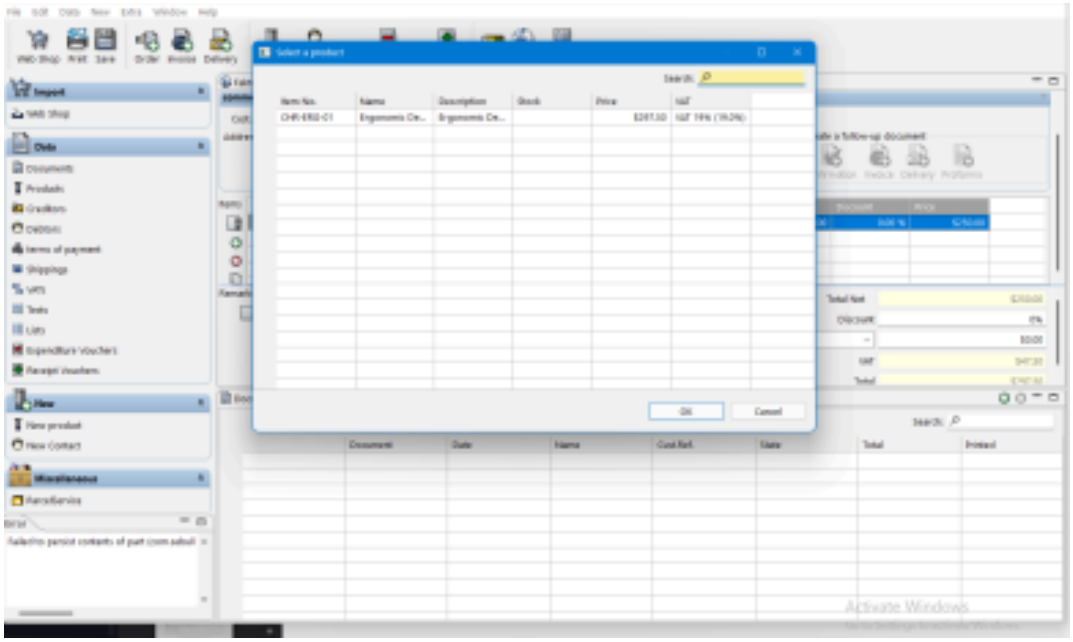

Figure 5. Product selector used to find an exact SKU from the open Order.

3.4. Keep the **Order** tab open. Before opening **New product**, open **Data > VATs** and search for the exact required name, such as **VAT 19%**.
3.5. Reuse one exact **VAT** row only when its **Name** matches **VAT** followed by the extracted percentage, its **Value** matches that percentage, and **VAT code (E-Invoice)** is **S (Standard rate)**. If any setting conflicts, stop for manual review.
3.6. If the **VAT** is missing, click the green + control and set **Name** and **Description** to **VAT** followed by the percentage, keep **VAT code (E-Invoice)** as **S (Standard rate)**, set **Value** to the percentage, and leave the displayed **Standard VAT** unchanged. **Save** once. See Figure 6.

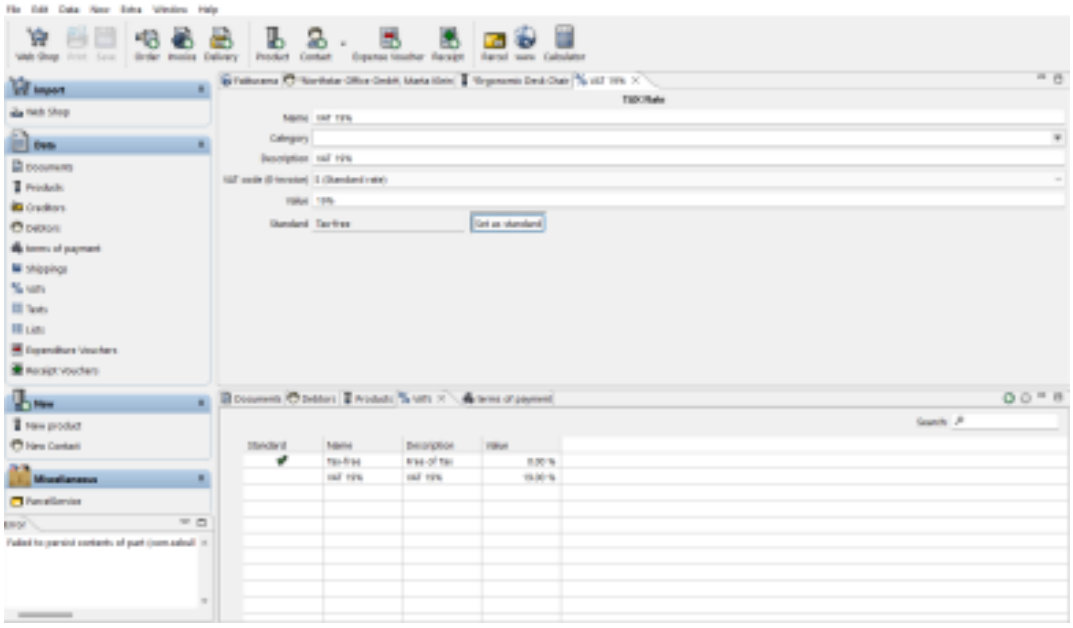

Figure 6. Conditional VAT 19% setup with the Standard rate code and 19% value.

3.7. Click **New product** only after the required **VAT** exists, so it is available in the **Product VAT** dropdown.
3.8. Set **Item Number** to the extracted **SKU** and set both **Name** and **Description** to the extracted item description.
3.9. Calculate **Price (gross)** as **Unit net price** x (1 + **VAT** percentage / 100), rounded to two decimal places. Do not apply the transaction-line discount to this **Product** master price.
3.10. Set **cost price (net)** to 0.00, select the exact **VAT**, and set **Stock** to 0.00. Leave **Category**, **GTIN**, supplier code, allowance, **Product Picture**, and user defined field 1 blank or unchanged. See Figure 7.

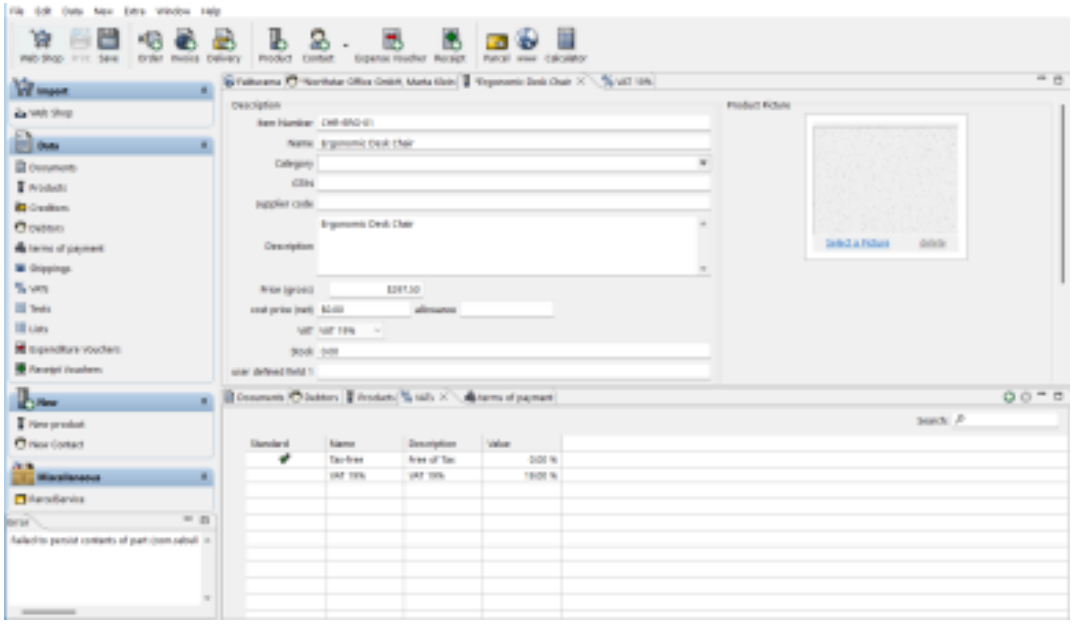

Figure 7. Conditional Product creation with the calculated gross price and required VAT selected.

3.11. Click the toolbar **Save** control once.
3.12. Return to the still-open **Order**, reopen **Select a product**, search the exact **SKU**, select the newly saved **Product**, and click **OK**. If it does not appear, stop for manual review.

Complete the selected item line

3.13. Set **Qty.** to the extracted quantity.
3.14. Set or confirm **U.Price** equals the extracted **Unit net price** and **VAT** equals the extracted percentage.
3.15. Set the line **Discount** to the extracted item discount.
3.16. Confirm line **Price** equals quantity x unit net price x (1 - discount / 100). 3.17. Repeat **Product** selection and line completion for every remaining source item.

4. Complete and save the Order

4.1. Confirm the selected **Debtor** addresses and every **Product** line match the extracted image.
4.2. Keep the overall **Discount** at 0% and **Shipping** at **Free of shipping costs** / 0.00 unless the image supplies corresponding order-level values.
4.3. Confirm **Total Net**, **VAT**, and **Total** match the source totals.
4.4. Click the toolbar **Save** control once.
4.5. Open **Data > Documents** and confirm one **Order** row with the generated number, expected **Date** and **Cust.Ref.**, open state, and **Total**. See Figure 8.

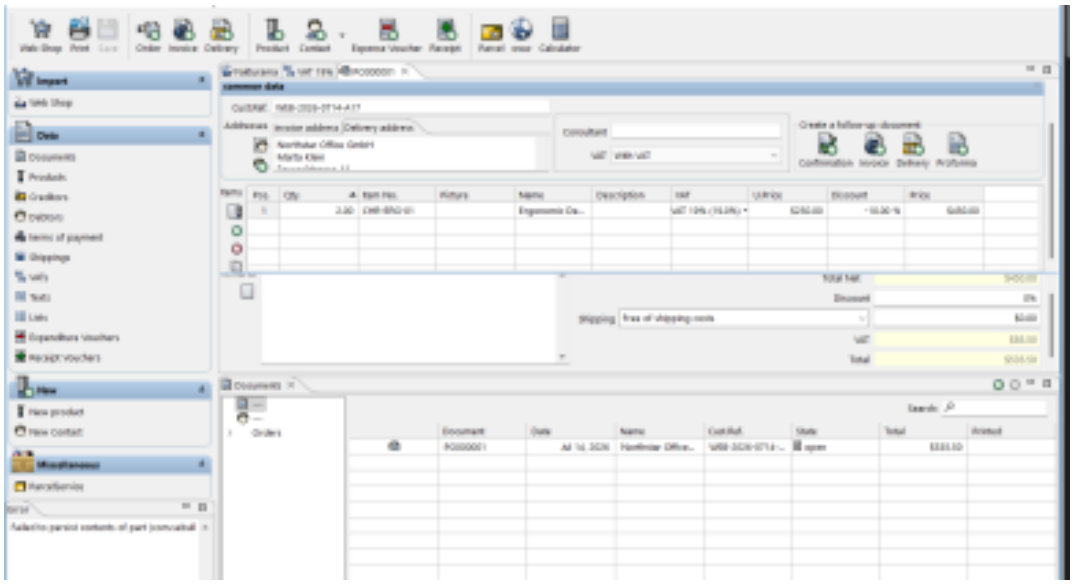

Figure 8. Illustrative saved single-line Order with its reference, totals, open state, and follow-up actions.

4.6. From the saved **Order**'s **Create a follow-up document** area, click **Invoice**. Do not use the **Invoice** button in the top toolbar because the follow-up action preserves the **Order** relationship.
4.7. Wait for the linked **New Invoice** editor, then continue to the final stage.

5. Complete and verify the linked Invoice

5.1. Leave the automatically proposed **Invoice No.**, **Invoice Date**, and **Service date** unchanged. Confirm **Cust.Ref.**, **Invoice address**, **Delivery address**, **Order Date**, **VAT** mode, item lines, and totals were copied from the **Order**. See Figure 9.

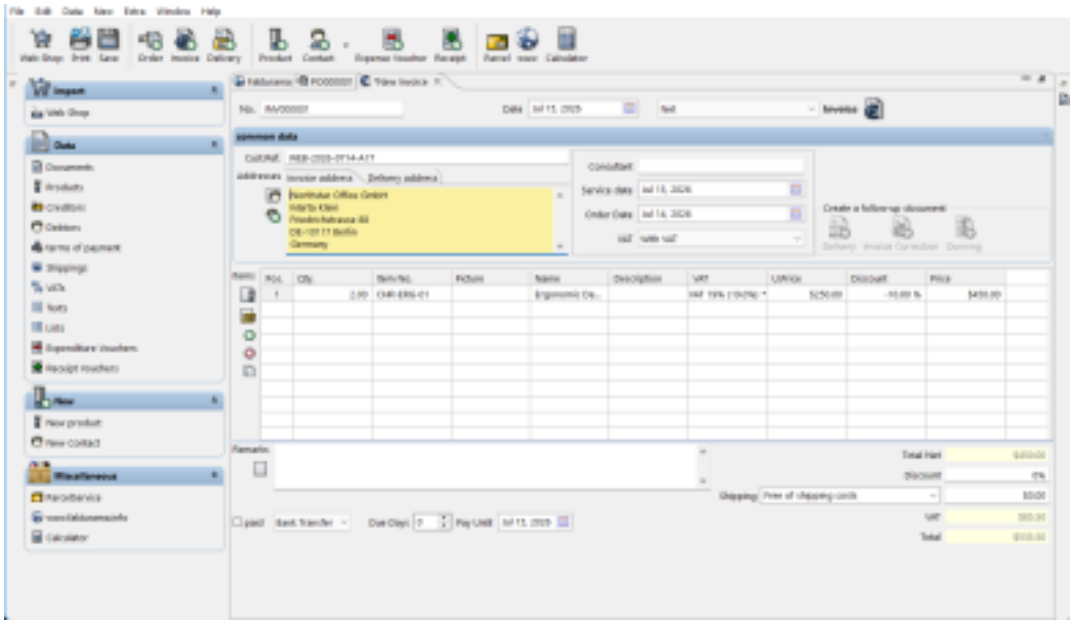

Figure 9. Illustrative linked single-line Invoice populated from the saved Order.

5.2. Set or confirm the **Invoice** payment method equals the **Payment Method** extracted from the image. If the required method is not available, stop for manual review.
5.3. If **Paid Status** is **PAID**, select **paid**, set the payment date to the extracted **Payment Date**, and set **Value** to the full **Invoice Total**. If the status is not **PAID**, leave **paid** clear and do not invent a date or value.
5.4. Click the toolbar **Save** control once.
5.5. Open **Data > Documents** and confirm the **Invoice** row has the expected state and **Total** while the source **Order** remains open with the same **Cust.Ref.** and **Total**. See Figure 10.

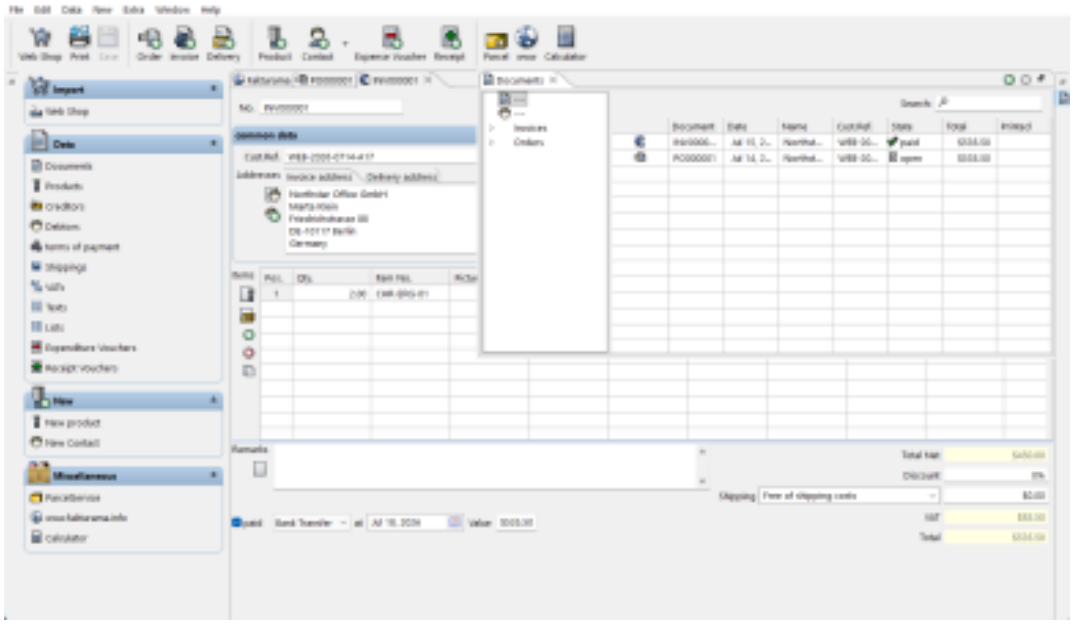

Figure 10. Illustrative final verification of a paid single-line Invoice and its open source Order.

5.6. Reopen the **Invoice** only if needed to confirm the persisted payment method, paid state, payment date, and **Value**.
5.7. The flow ends after this verification. Do not create a **Delivery**, **Correction**, or **Dunning** document.

Deliverables

- [ ] Source code with a clear structure in a Git repo
- [ ] Setup instructions: dependencies and how to run the automation against Fakturama
- [ ] Annotated screenshots or a short recording
- [ ] README

Written questions

1. If you had 3 more hours, what would you do for this task?
